"A Method of Making Multilayered Piezoelectric Transformers"

USSR Author's Certificate No 264497, filed 26 Jul 68, published 12 Jun 70
(from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12V387 P)

Translation: A method is proposed for making multilayered piezoelectric transformers. The procedure is based on making the excitation sections from separate plates with subsequent acoustic joining of the sections. To increase the transformation ratio, useful power and maximum permissible stresses, the plates of the excitation section are made from an unannealed piezoelectric material by pouring the slip onto the substrate, and acoustic joining of the sections is done simultaneously with brazing of the electrodes by pressing the sections in bundles at the ceramic sintering temperature.

"Investigation of the Effect of Temperature Self-Stabilization in the SHF Band"

Elektron. tekhnika. Nauchno-tekh. sb. Radiodetali (Electronic Technology. Scientific and Technical Collection. Radio Components), 1970, vyp. 1(18), pp 47-50 (from RZh-Radiotekhnika, No 11, Nov 70, Abstract No 11B152)

Translation: The authors discuss the effect of temperature self-stabilization which is observed in some ferroelectric crystals. Strong dielectric dispersion which occasions considerable losses in the ferroelectric phase results in the establishment of the SHF temperature self-stabilization mode. These losses lead to intensive heat release and heating of the ferroelectric by a SHF field past the Curie point. The results of an experimental study of ferroelectrics in strong SHF fields are given. Experimental relationships are given for the coefficient of losses in ferroelectrics as a function of temperature, as well as relationships for the dielectric constant and through power as functions of the suppressed power in the SHF range for a polycrystal specimen of barium titanate with impurities. The experiment was carried out on a frequency of 10 GHz. Four illustrations, bibliography of nine titles.

"Piezoceramic Shift-Type Transformers"

Kiev, Izvestiya VUZov SSSR--Radioelektronika, No. 5, 1970, pp 608-613

Abstract: The transformer is an electromechanical device with a double energy conversion capable of transforming an electrical voltage to mechanical oscillations (or the harmonics) caused by the resonance amplification of stresses and voltages. In the simplest case, the piezoceramic transformer is a three-lead component made of a piezoceramic bar with surface electrodes, and consists of an exciter and an oscillator. A periodic electric field applied to the exciter causes the whole bar to oscillate mechanically as a result of the inverse piezoelectric effect. Resonance oscillations and standing waves result at particular frequencies, the natural mechanical frequencies along one of the geometric dimensions. The amplitudes of the elastic stresses and strains are given a resonance amplification, and these stresses set up an electric field at the oscillator electrodes. The equivalent circuit of the piezotransformer is given, and some computational equations are derived. Also shown are diagrams of various arrangements of these transformers. The curve for the transformer coefficient as a

NEKRASOV, H. M., et al, Izvestiya VUZov SSSR--Radioelektronika, No 5, 1970, pp 608-613

function of the frequency indicates that a change in the load capacitance causes a change in the output signal amplitude as well as a large shift in the resonant frequency. These devices can thus be used in measurement devices involving sensors with a resonant circuit.

"The Drop Method of Removing the Glass Insulation From Microwires and its
Possibilities"

Elektron. tekhnika. Nauchno-tekhnik. sb. Radiokomponenty (Electronic Technology.
Scientific and Technical Collection. Radio Components), 1970, vyp. 1, pp
153-158 (from RZh-Radiotekhnika, No 5, May 71, Abstract No 5V421)

Translation: The authors evaluate the possibilities of using the drop method
of removing glass insulation to produce a contact joint in making filament
resistors and voltage dividers, and in adjusting resistors to their rated
value. It is experimentally shown that organic insulation of the Teflon type
can be applied to the wire. Some characteristics of the molten drop are
given (rate of glass destruction, etc.), together with the strength param-
eters of the wire. Resumé.

NEKRASOV, V. P.

psychologist

representatives of the medical service are standing watch. They are engaged in continuous monitoring of the physical and psychological states of crew members. The medical instrumentation has been activated and on a broad paper tape an automatic recorder is printing out curves and dashed lines which represent the complex of physiological indices for Lunokhod crew members. This will make it possible to evaluate the level of their neuroemotional stress.

"Now the horizon has disappeared on the screens of the video-monitoring devices. The Lunokhod has entered a crater and the field of view of its television camera rests on a slope studded with rocks. Immediately there is a change in the nature of the curves on the paper tape. But the vehicle has reached an even slope and its side-to-side and fore-to-aft listing is normal. The curves and lines also become normal."

"The Lunokhod crew members," states V. P. Nekrasov, director of the medical service, "are experiencing great physical and emotional stress. The level of their psychological stress during the time of their work is exceptionally high. Accordingly, we have introduced constant monitoring of performance which will to a great extent determine the reliability of actions by crew members and the correctness of the decisions which they have adopted..."

Such observations are not being made only during the time of communication contacts with the self-propelled vehicle. Special portable apparatus is being used in systematic evaluation of changes in a number of psychophysiological indices, including the state of the visual and motor analyzer and also the key psychic functions: memory, attention and cognition.

V. P. Nekrasov demonstrates an electronic instrument created for this purpose. On a small panel there is an array of small lights and buttons. For example, it is necessary to take in the hand a pin, a thin metal rod, and to insert it into an opening with a diameter a little larger and during a definite time period attempt to hold it in such a way that it will not touch the walls. I do this, what seems to be a simple operation, but I immediately hear the warning sound of a buzzer: the pin has touched the walls. A high performance is exhibited by anyone who holds the pin in its socket for 20 seconds while touching the walls of the opening not more than 10 times.

Another test is for emotional stability. A small red lamp lights up before you on the panel. It must be extinguished as quickly as possible by pressing a button. In order to obtain a high rating one must press the button not later than 1/5th of a second. But now unexpectedly a small white lamp lights up before you. An emotionally stable man must not react to it.

There is a more complex experiment in which two men compete in distinguishing the red lamp. Each man has his own button. Using a measuring instrument the physician precisely determines which of the competitors

"Improvement of Profiles of the Tail Connections with Turbine Blade Shoulders"

Kiev, Problemy Prochnosti, No 8, Aug 73, pp 81-84.

Abstract: Results are presented from experimental studies using short-base (1 mm) tensometer sensors, defining the distribution of maximum elastic stresses in tail joints with turbine blade shoulders with supporting surfaces perpendicular to the axis of symmetry of the profile. It is suggested that profiles be improved by making the supporting surfaces with skew angles greater than 0. It is demonstrated that tail joints of the improved design have maximum elastic stresses 2 to 3 times less than those currently used with 0 skew angle.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE DISTRIBUTION, DENSITY AND SOME BIOLOGICAL CHARACTERISTICS OF COLONIES OF THE RED CHEEKED SUSLIK (*BITELLUS MAJOR*) WERE STUDIED IN 1969 IN THE NORTHERNMOST PART OF ITS ZONE (SYSLERT' DISTRICT, SVERDLOVSK REGION). FLOODPLAIN AREAS, WASTELANDS AND PASTURES ARE MOST OFTEN SELECTED FOR THE SCATTERED COLONIES. NO APPRECIABLE POPULATION DENSITY WAS NOTED IN THIS AREA. THE LARGEST COLONY CONTAINED 17 ADULTS AND YOUNG, BUT THE NUMBER SHARPLY DECREASED IN AUGUST AS A RESULT OF EXTERMINATION. THE NUMBER OF YOUNG IN A LITTER VARIED FROM FOUR TO EIGHT, WITH FIVE TO SIX MOST COMMON. THIS INDICATES THAT THE NUMBER OF YOUNG IN THE LITTER DID NOT INCREASE, AS IT SOMETIMES DOES AMONG MAMMALS IN THE NORTHERNMOST PARTS OF THEIR RANGE.

"Participation of Kidney and Blood Kinins in Adaptation to Physical Exercise"

Moscow, Kardiologiya, No 9, 1972, pp 58-63

Abstract: A group of 70 persons age 18 to 35 (30 "intellectuals" in good health but not active in sports and 40 well-trained athletes) was required to operate a bicycle ergometer with steadily increasing resistance until they were physically unable to continue. In the untrained individuals, exercise decreased the excretion of the kinins, kallikrein and sodium with urine but stimulated the blood kinins. In the athletes, on the other hand, exercise increased the excretion of kinins and kallidrein with urine but had no effect on sodium. The better condition the athlete was in, the more had no effect on sodium. The better condition the athlete was in, the more the renal kinin system was stimulated. However, the response of the athletes blood kinins to the physical exertion was less pronounced than in the "intellectuals". Thus, regular training alters the blood and renal kinins. The state of these systems may be one of the humoral mechanisms responsible for the high hemodynamic adaptation capacity of well-conditioned athletes.

"The Effectiveness of Prometrin Against Weeds on Carrot Seedlings and the Occurrence of Its Residues in the Crop and in the Plant"

Moscow, Khimiya v Sel'skom Khozyzystne, No 7, Vol 11, 1973, pp 61-63

Abstract: Prometrin -- 2-methylthio-4,6-bis(isopropylamino)sym-triazine -- is one of the herbicides suggested for use on carrots in the Alma-Atinsky region. Under the conditions in this area, prometrin was singularly effective against annual monocotyledon and dicotyledon weeds. The amount of control for 3 years -- 1969 through 1971 -- is shown together with the meteorological conditions. Values for several indicators of plant productivity and vitality are shown for a control group and groups treated with 1.5 kg/hectare or 2.0 kg/hectare for 1969 and 1970. In doses of 1.5 kg/hectare it reduces the choking by 97.0% and the overall mass of weeds by 96.8%. No adverse effects on the seedlings or residue in the crop were observed for this dose. Residues were observed when higher doses (2.5 to 3.5 kg/hectare) were used.

"Laws of Variation of the Structure and Properties of Beryllium-Aluminum Alloys"
Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 7, 1970, pp 50-55

Abstract: This article contains a discussion of the laws of variation of the structure and properties of beryllium-aluminum hypereutectic alloys. Various amounts of magnesium were added to the alloy to produce various changes. By generalizing the results of x-ray micrography a diagram is constructed for the decomposition of a solid solution of aluminum-beryllium alloy with 30% Be and 5% Mg. The variation in mechanical properties of the same alloy is plotted for aging at 200°C and at 250°C. The strength of aluminum-beryllium alloys as a function of the distance between the B-phase particles (the distance between the beryllium particles) is also plotted for Al-Be and Al-Be-Mg. The mechanisms of all these variations in structure and properties are discussed in detail.

"A Working Electrolyte for Aluminum Electrolytic Capacitors"

Moscow, Otkrytiya, izobreteniya, promyshlennyye obraztsy, tovarnyye znaki,
No 16, Jun 71, Author's Certificate No 303662, Division H, filed 11 Oct 69,
published 13 May 71, p 187

Translation: This Author's Certificate introduces a working electrolyte for aluminum electrolytic capacitors. The electrolyte is based on ethylene glycol, boric acid, adipic acid and ammonia. As a distinguishing feature of the patent, in order to stabilize the electric parameters and internal pressure of the capacitors during long-term operation, phosphoric acid is added to the electrolyte with the following ratio of components (in parts by weight): ethylene glycol--10-120, boric acid--1-10, adipic acid--1-10, ammonia--2-10, phosphoric acid--1-2.

and Institute of Molecular Biology, Academy of Sciences, USSR, Moscow

The structure of four histone fractions (H_1 , $\text{H}_2\text{(a)}$, $\text{H}_2\text{(b)}$, H_3) has been studied by the methods of optical rotatory dispersion, potentiometric titration and viscometry. The analysis of the data obtained made it possible to draw a conclusion that histones are not globular proteins. The dependence of reduced viscosity on the charge of the molecule and the ionic strength of the solution showed that the dimensions of the histone molecules depend to a large extent upon the forces of electrostatic interaction. This suggests that the histone molecules are conformationally flexible and probably exhibit the conformation of a statistical coil with the incorporation of helical regions.

72

REEL/FRAME
19771000

02

AP0044384

The potentiometric titration curves have been obtained for all the histone fractions and have been used for calculating the number of ionizable groups, for determining their pK' and the change in the mean overall charge of the molecules with the pH alteration of the medium. The effect of pH and the ionic strength of the solution on the α -helix content of various histone fractions was studied. The data obtained were compared and a conclusion was drawn about the non-uniform distribution of the charged groups in the histone molecules. On one hand, histones contain at neutral pH coil shaped sequences enriched with basic amino acid residues with high density of the positive charge and on the other hand, regions capable to form helical structures and containing both acid and basic amino acid residues. A model is proposed describing the structure of histones.

The important differences between histone fractions were shown to exist mainly due to the distribution of the charges along the chain.

CHANGE IN GROWTH PROCESSES IN IRRADIATED LETTUCE SEEDS

Article by Yu. I. Shaudorov, A. T. Miller, I. V. Alekseev,
and A. O. Krukov, and V. V. Nechaeva, Moscow, Kosmicheskaya Biologiya
[Cosmic Biology], Vol. 5, No. 6, 1971, submitted for publication 25 June
1971, pp. 21-26.

Abstract: The effect of spaceflight factors on the biological effectiveness of γ -rays was studied with respect to lettuce seeds. It was found that the flight exerted no significant effect on the energy of seed germination. The length of the primary root in flight specimens irradiated before flight was similar to that in the ground control. According to this test, flight factors increased the effectiveness of postflight irradiation significantly. The influence of a synchronous exposure inhibited the weight of 20-day plants to the greatest extent. The seed exposure to all three doses tested during the flight resulted in a slight decline of plant weight in comparison with the laboratory control.

We studied the influences of flight factors and ionizing radiation on initial growth processes (germinating energy and germination of seeds, growth of the primary root), and also on the appearance of aftereffects of the studied phenomena in breeding plants. The experimental plan provided for a clarification of the influence of flight factors on the appearance of a radiobiological effect (seed irradiation prior to flight) and the radiosensitivity of seeds (seed irradiation after flight). As is well known, the radiation effect on dry seeds begins to appear with the onset of their germination. At that time one observes both the realization of the damage and the oppositely directed processes associated with a normalization of plant growth mechanisms. During the initial growth period the damaging effect of radiation is most clearly manifested. With an increase in plant age recovery processes begin to predominate and in the case of small irradiation doses the radiation effect can be smoothed out.

EFFECT OF ILLUMINATION ON THE RADIATION EFFECT IN LEAF CABBAGE AFTER

IRRADIATION BY PROTONS AND GAMMA RAYS

All-Russia Institute

Article by L. S. Shukina, Yu. I. Shvidorov and V. N. Nekrasova - Moscow,
Radiochekhizdat, Nekrasova, Kirovskaya 1, Moscow, Russia, Vol. 3, No. 3, 1971, submitted
for publication 1 February 1971, pp. 84-87]

Illumination conditions (light intensity, its spectral composition, duration of light and darkness) in many respects determine the interrelation of biochemical processes transpiring in the plant organism (Zh. L. Volkman; E. A. Titlyanov, et al.; N. P. Voskresenskaya), and also its reaction to external stimuli. In particular, this factor plays more than a little role in the nature of plant response to radiation. Accordingly, by creating appropriate illumination conditions it is possible to change the direction of physiological and biochemical processes in a plant in such a way as to increase their radiation tolerance and capacity for recovery.

For example, according to data published by V. N. Savin (1962), the cultivation of tomato plants from irradiated seeds with no illumination of 50,000 lux leads to an attenuation of the radiation effect in comparison with an illumination of 10,000 lux. A similar phenomenon was observed during the cultivation of radish plants from irradiated seeds (N. P. Batygin and V. M. Savin). At the same time, different illumination during the pre-irradiation period (5,000-5,000 and 30,000 lux) exerted no influence on radiation effectiveness (N. P. Batygin and L. A. Mis'yuk). A shortening of the light period from 12 to 6 and 8 hours during the cultivation of petunia plants under fluorescent lamps resulted in an increase in the effectiveness of gamma radiation (V. N. Savin, 1965). No found no data in the literature on the influence of illumination on the effectiveness of protons.

Since ionizing radiation constitutes the greatest danger for plants on space vehicles, it appears desirable to study different plant illumination conditions as a possible radioprotective factor.

"Sorption of Water Vapor by the Strong-Acidic Cationite KU-5"

Kiev, Ukrainskiy Khimicheskiy Zhurnal, Vol XXXVII, No 8, 71, pp 785-789

Abstract: Hydration of the KU-5 sulfocationite, apart from immediate practical importance, is of definite theoretical interest. Comparison of the sorption properties of corresponding saline forms of KU-5 and KU-2 having the same fixated ions ($\text{--SO}_3\text{H}$) but different matrices will evidently show the effect which chemical structure of the skeleton and certain physico-chemical parameters of the ionite have on interaction between water molecules and active centers of the ionite.

The K^+ , Na^+ , Li^+ , Ca^{2+} , Mg^{2+} and Al^{3+} forms of commercial KU-5 were tested, completeness of substitution being judged by the Al^{3+} form (analytical determination of amount of Al in the initial solution and following passage through the resin).

Water-vapor isotherms for KU-5 were similar in shape to those of other high-hydrophylic substances (initial sharp rise followed by more moderate rise 1/2

USSR

GOROKHOVATSKAYA, N. V., et al., Ukrainskiy Khimicheskiy Zhurnal, Vol XXXVII,
No 8, 1971, pp 785-789

and final sharp rise). Evidently a monolayer of adsorbed water molecules is first formed at the most active centers, followed by hydration of less active centers and finally by capillary condensation of the vapor, accompanied by swelling of the ionite. Graphic representations of data obtained are included.

"Hydration Thermodynamics of a Strong Acidic Cation Exchange Resin KU-5"

Kiev, Ukrainskiy Khimicheskiy Zhurnal, Vol 38, No 10, Oct 71, pp 1013-1017

Abstract: Results of sorption-thermochemical determinations and analysis of thermodynamical functions of water adsorbed by the cation exchange resin KU-5 are reported. The K^+ , Na^+ , Li^+ , Ca^{2+} , Mg^{2+} , and Al^{3+} forms of the resin were studied and the data were calculated from sorption and thermochemical determinations carried out at 20°. It has been established that the graphs of function magnitudes related to the quantity of the adsorbed water reflect the hydration process laws which are connected with the nature of fixed and exchange ions. Analogously to other investigated cation exchange resins, the most informative are the functions $E_G = f(x)$; from them it is possible to get qualitative estimates on the input of various types of interactions to the total hydration energy.

"Sorption-Thermochemical Study of Hydration of Macroporous KU-23 Sulfocation
Exchange Resin"

Kiev, Ukrainskiy Khimicheskiy Zhurnal, Vol XXXVIII, No 6, 1972, pp 581-586

Abstract: The sorption and thermochemical methods were used to study the hydration of macroporous KU-23 sulfocation exchange resin in hydride and four salt forms (Li^+ , Na^+ , K^+ , Ca^{2+}). The thermodynamic functions of the sorbed water were defined on the basis of the data obtained, and study was made of the nature of their variation during the hydration process. On the graphs of the differential entropy, there are three sections corresponding to different hydration mechanisms. The results of the studies are compared with data obtained earlier for the KU-cation exchange resin.

A study was made of the 20° isotherms of the sorption of water vapor taken on a vacuum sorption device with spring-quartz scales, the heats of wetting by water defined in an adiabatic calorimeter and the thermodynamic functions of the water sorbed by the ion forms of the macroporous KU-23 sulfocation exchange resin. The procedure for preparing and performing the measurements was described previously [M. Dubinin, et al., Fiziko-khimicheskiye osnovy protivogazovogo dela, Moscow, 1939; A. V. Dumanskiy, et al., Ukr. khim. zh., No 26, 389, 1960].

"Generation of High-Speed Plasma Fluxes by a Pulse Accelerator on the Basis of the Phenomenon of Electric Detonation of Conductors and Dielectric Erosion"

Minsk, Doklady Akademii Nauk BSSR, Vol XVI, No 2, 1972, pp 115-117

Abstract: A study was made of a pulse generator of a moving plasma created by electric detonation of conductors of defined form in a bounded volume. The described plasma generator can operate in two versions -- on the basis of electric detonation of conductors as a source of a metal plasma or using pulse surface discharge where the plasma is formed as a result of erosion of the walls of the discharge chamber and the electrodes. The described pulse plasma generator permits the creation of incompletely expanded supersonic erosion plasma jets at atmospheric pressure with given gas dynamic characteristics determined by the discharge conditions and parameters.

Utilization of the phenomenon of electric detonation of conductors of a defined form under conditions of operating the plasma generator with an

pp. 115-117.

auxiliary gap introduced into the discharge chamber permitted flows of a low-temperature metal plasma of any given chemical composition to be obtained with relatively high efficiency of utilization of the stored initial energy. The energy in the discharge gap for $V = 4$ kilovolts and $C = 200$ microfarads (mode I) was calculated from the current and voltage oscillograms as 1.3 kilojoules with an initial energy of 1.6 kilojoules. This essentially exceeds the energy contributed in the case of operating the generator with an external auxiliary gap (0.5 kilojoules). Optimization of the discharge conditions and the geometry of the discharge chamber and, consequently, the detonated conductor permitted incompletely expanded supersonic plasma jets to be obtained at atmospheric pressure with an escape velocity of $v = 25$ km/sec for a contributed energy of 1.3 kilojoules (mode I). The presence of intense continuous and linear spectra is a characteristic feature of the emission of the erosion plasma ($V = 5$ kilovolts, $C = 1,950$ microfarads (mode II) without electric detonation of the conductors) formed inside the discharge chamber. Spectroscopic measurement of the plasma temperature and concentration ($T = 6,000^\circ$ K, $n_e = 5 \cdot 10^{16} \text{ cm}^{-3}$)

indicates the formation of a relatively dense low-temperature plasma. When the plasma generator is operated with electric discharge of the conductors under the same discharge conditions, the plasma concentration increases appreciably.

"Impact Adiabats and the Short-Range Shock Zone in Drilling Solutions of Different Density"

Novosibirsk, Zhurnal Prikladnoy Mekhaniki i Tekhnicheskoy Fiziki, No 3, May/Jun 73, pp 77-82

Abstract: A study is made of impact adiabats and the short-range shock zone in a model drilling solution based on water, bentonite clay, carbon alkali reagent, and fire-grate dust as a weighting compound. The main control parameters were density and "funnel" viscosity determined by standard methods. A diagram of the test installation is given and the measurement procedure is described. The results are given in the form of tables and graphs. It is found that the specific impulse of a shock wave in the short-range region of a blast increases in approximate proportion to the initial density of the drilling solution. The viscosity of the drilling solution has no effect on the nature of propagation and amplitude of the shock wave in the short-range region of the blast.

"Optimizing the Reliability of Elements of Complex Systems With Regard to Economic Factors"

V sb. Osnovn. vopr. teorii i praktiki nadezhnosti (Basic Problems in the Theory and Practice of Reliability--collection of works), Moscow, "Sov. radio", 1972, pp 298-327 (from RZh-Kibernetika, No 1, Jan 72, Abstract No 1V1118)

Translation: The paper deals with the effect of economic factors on requirements for reliability of elements and systems as a whole. It is shown that in regard to these factors, the attempt to maximize reliability is neither economically nor technically feasible. An approach is presented for the problem of establishing effective reliability limits; and a method is outlined for optimizing the reliability of elements in restorable systems. Author's resumé.

"Experimental Study of the Hydraulic Characteristics of Cylindrical Grids"

Neft' i gaz. Tyumeni. Nauch.-tekhn. sb. (Oil and Gas of Tyumen'). Scientific-Technical Collection), 1972, No. 15, pp 49-51 (from RZh-Mekhanika, No 3, Mar 73, Abstract No 3B395)

Translation: The hydraulic characteristics of cylindrical grids with ordinary circular openings and with openings of variable shape which are obtained by displacement of an external movable cylinder attached to the cylindrical lattice are investigated. All measurements were conducted under industrial conditions on natural samples at high gas flow rates and at a pressure of 95 kg/cm². The investigation showed the basic analytical relationships determining the gas flow through the cylindrical grids. Graphs are given of ΔP , R and ζ as a function of b for different coefficients of the dynamic cross section of the grids. 5 ref. V. P. Aleksandrov.

DESIGN OF OPTIMAL AND QUASI-OPTIMAL SYSTEMS OF AUTOMATIC CONTROL

Acad. Sci.
Moscow, Doklady Akademii Nauk SSSR, Russian,
Article by R.A. Nelepin, Vol. 201, No. 4, 1972, pp. 903-905

Let an object of automatic control be described by the system

$$\frac{du_k}{dt} = \sum_{i=1}^n a_{ki} u_i + b_{ki}, \quad k=1, \dots, n, \quad (1)$$

where u_k are the coordinates of the object, a_{ki} , b_{ki} are the constant coefficients, u is the control. By using the analytical methods of the theory of optimal control which enables one to design the control u from the condition of the minimization of some functional, the following difficulties are encountered: 1) it is necessary to select the weighted coefficients of the functional according to additional criteria of the quality, which are usually conducted with research of a system of non-linear differential equations; 2) ordinarily it is necessary to calculate the coefficients of the optimal law of control from systems of equations of large dimension; 3) the optimal law of control is altered by natural nonlinearities in its realization. It is necessary to select the parameters of a control system in such a way that its processes will be distinguishable in a sufficiently small manner from the processes in the optimal system. The method under consideration enables us in a number of instances to overcome these difficulties.

The control u can be designed on the basis of the so-called local criteria. Let λ_i be the eigen-values of the matrix $\{a_{ki}\}$; under the constraints

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE RELATION OF THE CAKING TENDENCY TO THE DEGREE OF DISPERSION OF (NH SUB4) SUB2 SO SUB4 WAS DETERMINED. THE GRANULAR FORM IS PREFERRED TO THE CRYST. THE CAKING TENDENCY INCREASES WITH THE FINENESS OF (NH SUB4) SUB2 SO SUB4. WHEN STORED FOR 33-63 DAYS IN MOISTURE PROOF SACKS THE DISPERSIVITY OF (NH SUB4) SUB2 SO SUB4 WAS NOT IMPAIRED. SINCE THE AGROPHYS. PROPERTIES OF (NH SUB4) SUB2 SO SUB4 DEPEND SO MUCH ON THE MOISTURE CONTENT, IT IS RECOMMENDED THAT THE MOISTURE CONTENT SHALL NOT EXCEED 0.3PERCENT AND THE AMT. OF FREE ACID SHOULD BE BELOW 0.04PERCENT. A HIGHER AMT. OF ACID ENHANCES THE HYGROSCOPIC PROPERTY OF (NH SUB4) SUB2 SO SUB4 CONSIDERABLY AND MAKES IT MORE DIFFICULT TO HANDLE.

"Optical Characteristics of p-Type $Pb_{1-x}Mn_xTe$ Solid Solutions"

Leningrad, Fizika i tekhnika poluprovodnikov, No 8, 1972, pp 1478-1482

Abstract: The work described by this paper is the investigation of infrared reflection and absorption spectra in solid solutions of $Pb_{1-x}Mn_xTe$, with the purpose of explaining the energy structure of these alloys. The reflection spectra were measured with specimens having various carrier concentrations and with an Mn concentration of up to 9% at 300° K, and such spectra are plotted for alloys in which $x = 0.03, 0.06, 0.09$ with identical Hall concentrations. The absorption spectra were obtained for polycrystalline specimens of $Pb_{0.95}Mn_{0.05}Te$ and $Pb_{0.9}Mn_{0.1}Te$ and are reproduced as well. It is found that the introduction of Mn into $Pb_{1-x}Mn_xTe$ alloys leads to a change in the respective positions of light and heavy hole zones, and that the structure of the alloys' valent zones differs substantially from those of $PbTe$.

"Characteristic Light Absorption in Nonparabolic Regions of PbTe
and Solid PbTe-SnTe Solutions"

Leningrad, Fizika i tekhnika poluprovodnikov, No 7, 1972, pp
1323-1326

Abstract: A comparison is made between the experimental data for the absorption coefficient of PbTe and compounds of similar zonal structure on the one hand, and the theoretical expressions derived on the basis of the two-zone model on the other. Computation of the characteristic absorption coefficient is made in the framework of the two-zone model by computing the matrix elements of the dipole junctions through the use of wave functions found by the E_p method. Such calculations show that the absorption coefficient in the nonparabolic zone increases because of the faster growth of the density of the compounds as a function of the energy. Experiments to determine the absorption of epitaxial films of PbTe, $Pb_{0.9}Sn_{0.1}Te$ and $Pb_{0.8}Sn_{0.2}Te$ are described. The results of these

"Infrared Absorption by p-Type $Pb_{1-x}Sn_xTe$ Alloys"

Leningrad, Fizika i tekhnika poluprovodnikov, vol 6, No 6, 1972,
pp 1046-1049

Abstract: The results of experimental investigations into the infrared absorption characteristics of n-type and p-type $Pb_{1-x}Sn_xTe$ solid solutions, where $x = 0.02, 0.05, 0.1$, and 0.2 , are given in this paper. Specimens for the experiments were prepared from alloys of the original components in evacuated ampoules, the components being heated by pressing and consequent homogenization by annealing. X-ray and metallographic analysis was used to verify that the specimen was single-phased. The absorption measurements were made with the IKS-21 infrared spectrometer, the temperature tests of the spectra being made in a special vessel to permit direct measurement of the absorption in a micro-attachment, type PMO-2M, in the $110-300^{\circ}$ K interval. The authors find that their results agree closely with the data obtained by other researchers.

- 112003w Ir-absorption spectra and interaction of isoprene with a modified Aerosil surface. Nelson, K. V.; Ikonitskii, L. V.; Ryzhikov, V. A. (USSR). *Zh. Prikl. Spektrosk.* 1970, 12(1), 80-4 (Russ.). The effects of the reaction between Aerosil (I) and TiCl₄ on the structural changes occurring in isoprene (II) during adsorption were studied by means of a spectrophotometer IR-10 at 2000-3750 cm⁻¹. Adsorption of TiCl₄ on I brought about the formation of reactive sites on which chemisorption of II took place. TiCl₄-modified I surface initiated the polymn. of II to give a nearly linear polyisoprene. On the other hand, adsorption of II vapors on a nonmodified I surface involved only a negligible interaction with the OH groups of I.

STUDIES OF THE TRANSPORT OF CARRIER IONIC AND ACCEPTOR ADJUVANTS FOR EPITAXIAL GROWTH OF SILICON BY THE SANDWICH METHOD. III - SUBSTRATE-SOURCE MATERIALS
[Article by B. G. Andrianov, I. M. Zhuravleva, G. F. Levent'ev, A. N. Nelyubova; however, source, incorrectly cited.] Strukturna Monokristallinenje Stoychey Polikristalil.

The Sandwich method of growing epitaxial layers of semiconductors based on the transport of the material through the volatile compounds by a reversible heterogeneous reaction between the new source and substrate in the presence of a temperature gradient is simple and convenient for laboratory practice. The possibility of obtaining Si layers with appreciably higher specific resistance than in the open chloride process with the same requirements on the purity of the initial reagents, the possibility of tailoring (when selecting the current-pooling, transport agent), with such admixtures of elements of groups III and V the working with the halides of which in the flow system is complicated, the possibility of working with highly alloyed sources without sensitization, the reaction and the gas bain — all of these justify the interest in the Sandwich method.

In order to obtain epitaxial layers of Si with given electrical parameters by the Sandwich method it is necessary to know in detail the transport coefficients of the alloying admixtures for specific process conditions (type of carrier, growth rate, impurity concentration in the source, and so on). The indicated problems as applied to silicon are explained highly incompletely in the literature [1, 2].

Koff = $\frac{K}{(1 + K)^2}$ (source (the concentration ratio of the admixture in the epitaxial layer and the source) of certain donor and acceptor admixtures P, As, Sb, In, Ga, Al) and their dependence on the transport conditions when transporting silicon through the volatile dichloride $SiCl_2$ by the reversible reaction

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. BORON WAS APPLIED TO CARROTS AND SUGAR BEETS GROWN IN POTS CONTG. SAND AT 1.0 AND 0.1 MG-KG, AND 4.0 AND 0.4 MG-KG, RESP. WHEN THE PLANTS WERE 90 AND 105-110 DAYS OLD, PRIME14 CD SUB2 WAS INTRODUCED FOR 1 HR. THE LEAVES AND ROOTS WERE ANALYZED FOR SUGARS AND RADIOACTIVITY. IN ANOTHER EXPT. A GROWTH INHIBITOR, 0.5PERCENT MALEIC HYDRAZIDE WAS SPRAYED ON THE PLANTS TO STUDY THE EFFECT ON CARBOHYDRATE TRANSPORT. BORON DEFICIENCY LED TO A BREAKDOWN IN SUGAR TRANSPORT NOT ONLY FROM THE LEAVES TO THE ROOT BUT INSIDE THE ROOT ITSELF. THESE CHANGES IN CARBOHYDRATE METABOLISM OCCURRED BEFORE ANY EXTERNAL SYMPTOMS OF B DEFICIENCY WERE OBSERVED. THE EFFECTS OF MALEIC HYDRAZIDE WERE SIMILAR IN MANY, BUT NOT ALL, WAYS. GROWTH PROCESSES AFFECTED THE TRANSLOCATION OF CARBOHYDRATES, AND GROWTH INHIBITION DUE TO B DEFICIENCY SHOWED UP IN THE SUGAR OUTFLOW.

"The Plague Microorganism (*Yersinia pestis*) as a Component of Burrow Microbiocenoses"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol. 42, No 1, Jan/Feb 73, pp 62-68

Abstract: The interrelationships of *Y. pestis* (*P. pestis*) with other components of burrow biocenoses are described. *P. pestis* is regarded as an obligatory nidicole requiring for its existence in deserts and semideserts the conditions typical for the system *P. pestis* - rodent - fleas in burrows. It is pointed out that for the long-term preservation of foci of plague the survival of *P. pestis* in the gastrointestinal tract of ticks is also of importance. *P. pestis* can be preserved in Ixodidae and Argasidae ticks for 1-3 years in a focus of infection without occurrence of an epizootic outbreak. Ticks of some species inhabit partly burrows and partly the outside surface used as pasture by animals. *Hyalomma asiaticum*, which inhabit burrows in the larva and nymph stages and pastures in the imago stage, transmit plague from rodents to camels. The frequency of infection of camels would be higher if these animals were less resistant and if infection did not proceed by a passive mechanism (crushing of 1/2

ticks and rubbing in of the ticks and of their excrements) rather than in an active way such as inoculation by fleas. In a footnote by the editors, it is pointed out that according to some experimental results lice may be of epizootiological importance as transmitters of plague from rodent to rodent.

"Morphofunctional Organization of Burrow Microbiocenoses of the Great Gerbil
in Northern Kyzyl-Kum. 2. Seasonal Aspects of the Structure of Burrow
Microbiocenoses"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, No 5, 1971,
pp 566-571

Abstract: The burrows of great gerbils are complex microbiotopes with equally complex microbiocenoses. The large capacity and intricate differentiation of the microbiotope (considerable length of the passageways and different kinds of chambers) favor the existence here of numerous and ecologically varied arthropods (blood suckers, entomophages, schizophages, euryphages, mycetophages, phytophages). The highly organized and comparatively stable gerbil biocenoses undergo seasonal changes. The species composition and relative numbers of the nidicolous insects and the distribution of blood suckers between host and burrow within the burrow proper vary from season to season. The two factors of basic importance are the seasonal changes in vertical stratification of the temperature in the burrow and the corresponding changes in gerbil behavior.

"Effectiveness of Benomyl against Verticillium Cotton Wilt"

Moscow, Khimiya v Sel'skom Khozyaystve, No 1, 1972, pp 22-24

Abstract: A study was made at the Andizhan branch of the All-Union Scientific Research Institute of Cotton Growing to determine the effect of various doses of benomyl on the rate of affection cotton with verticilliosis wilt, with injections of the fungicide in different ways and at different times. In the vegetative experiment benomyl injected into the soil was absorbed by the roots of the cotton plant and reached the leaves through the stalk as a result of which the development of verticilliosis wilt was almost completely suppressed. In lisimeters and under field conditions, benomyl was less effective by comparison with the vegetative experiment, but this is explained by poor procedures used in applying the fungicide. Comparative data for the various experiments are presented in tabular form. In the vegetative experiments, the number of bolls and the weight of the cotton in them were both increased. The maximum increase in yield (36 grams per plant) occurred for injection of benomyl in the amount of 6 grams into the vessel to a depth of 20 cm. About the same increment was obtained in the version with a 12 gram dose. This indicates that benomyl is not toxic to cotton.

napravleniy pri razrushenii prod vzyvom. Gosgortekhnadzor, 1962) that rocks be divided into three groups based on the physicomechanical properties and manner of occurrence of the destruction process (by low, medium and high acoustic rigidity). Moninets (LAN KIRSSR, 1963) established that 75-80% of the total destruction is created in advance by stress waves propagating in the rock mass, and it is completed by the piston action of the gaseous explosion products. According to Drukovskiy and Komir (IN: Sbornik... Verymoye delo, 1965) the mechanism of rock destruction from an explosion is determined by the value and duration of the explosive impulse. Melnikov and Marchenko (ICO AN SSSR, 1959) proposed a method for decreasing the explosion energy loss by using charges dispersed lengthwise by air intervals.

The mechanism of the action of Ignatov was reported on by Demidov (IN: Sbornik... Verymoye delo, no. 45, 1960). The authors note in conclusion that a large number of differing and in some cases contradictory theories have been presented on explosive effects in rocks, and remain to be reconciled.

NematoV, L. Propagation of one-dimensional spherical shock waves in soil (direct problem). IN: Voprosy vychislitel'noy prikaznoy matematiki, Tashkent, no. 7, 1971, 115-119 (RZhMeh, 5/72, #54501)

The problem is considered of the propagation of a shock wave formed during the expansion of a sphere, i.e. an unbounded space. At the initial moment of time, the spherical surface instantaneously acquires a finite velocity, which then changes in accordance with a given law. The solution is worked out on a computer by the method of characteristics. The obtained values of the velocity and deformation of particles in the shock wave are presented as functions of time and space coordinates.

CIRC ACCESSION NO--AT0055068
ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A NEW NATURAL GAS PROVINCE, CONTG.
RICH RESOURCES, WAS DISCOVERED RECENTLY IN THE NORTHERN PART OF WEST
SIBERIAN LOWLAND. THE GAS DEPOSITS THERE ARE CONFINED TO THE CENOMANIAN
STRATA FORMING AN UPPER PART OF THE POKURSK OILBEARING SERIES
(APTIAN-ALBIAN-CENOMANIAN) WHICH CONSIST MOSTLY OF CONTINENTAL COASTAL
MARINE FACIES. THE ISOTOPIC COMPN. OF C IN THESE GASES WAS DETD. AND
COMPARED WITH THE PDB (THE CHICAGO STD. WITH PRIME12 C.. PRIME13 C EQUALS
88.99PERCENT) TO DET. THE ORIGIN OF GAS IN THESE DEPOSITS. THE DEPOSITS
OCCUPY A SPECIAL POSITION AMONG THE OTHER NATURAL GAS DEPOSITS OF YOUNG
PLATFORMS, SITUATED IN MESOZOIC FORMATIONS, BEING MUCH RICHER IN PRIME12
ISOTOPE (DELTA PRIME13 C FROM MINUS 5.83 TO MINUS 6.78PERCENT). E.G.,
THE GASES OF BUKHARA-KHIVA (TURANSK PLATFORM) HAVE DELTA PRIME13 C FROM
MINUS 3.02 TO MINUS 3.82PERCENT AND GASES IN KRASNODAR DEPOSITS
(SCYTHIAN PLATFORM) HAVE DELTA PRIME13 C VARYING FROM MINUS 3.76 TO
MINUS 4.66PERCENT. THE DELTA PRIME13 C OF NORTHERN WEST SIBERIAN
DEPOSITS IS VERY SIMILAR TO THAT OF THE MARSH GASES IN EUROPEAN PARTS OF
THE U.S.S.R. WHERE IT VARIES FROM MINUS 5 TO MINUS 6.9PERCENT. THE
DEGREE OF ORG. SUBSTANCE METAMORPHISM INDICATED THAT CONDITIONS OF GAS
FORMATION IN NEW DEPOSITS WERE SIMILAR TO THE COALIFICATION IN
APTIAN-ALBIAN-CENOMANIAN DEPOSITS AND TO GAS FORMATION IN RECENT
MARSHES. THE MIGRATION OF GASES FROM DEPOSITS, UNDERLYING THE POKURSK
SERIES, WAS EXCLUDED BY THE DATA ON ISOTOPIC COMPN. OF HYDROCARBON GASES
OBTAINED DURING TESTING OF DEEP HORIZONS IN SOME OF THESE DEPOSITS
(DELTA PRIME13 C FROM MINUS 3.65 TO MINUS 4.56PERCENT).

"Thermal and Electrical Properties of Porous Titanium"

Kiev, Poroshkovaya Metallurgiya, No 8, Aug 70, pp 35-38

Abstract: A study was made of the dependence of the coefficient of thermal conductivity, the thermal expansion, the thermoelectromotive force, and the resistivity of titanium on 0-50% porosity in the interval from room temperature to 1200° C. Thermal conductivity and electrical conductivity decreased with an increase in porosity. It was not possible to apply formulas of generalized conductivity for the determination of the dependence of thermal conductivity and electrical conductivity on porosity. This is explained by the coarseness of grain size of the initial powder (1-0.1 mm).

"Temperature Dependence of the Absolute Thermo-e.m.f. Coefficient of Certain Transition Metals"

Moscow, Fizika Metallov i Metallovedeniye, Vol 30, No 5, 1970, pp 1088-1090

Abstract: The transition metals are widely used as structural materials in various high-temperature applications, particularly in electronic-vacuum devices. The high-temperature gradients and combinations of dissimilar metals may result in significant thermoelectromotive forces, which must be considered in many cases. Therefore, study of the thermoelectric properties of the transition metals is of great practical and theoretical significance. This work presents a determination of the temperature dependence of the absolute thermo-e.m.f. coefficient of the transition metals in subgroup IV A, as well as vanadium, chromium, iron, and nickel at 50-1,200°C. The nature of the temperature dependence of α_0 for ferromagnetic iron and the nonferromagnetic metals of

"Emission Properties of the Au-BaO System"

Tr. Leningr. politekhn. in-ta (Works of Leningrad Polytechnical Institute),
1970, No 311, pp 51-55 (from RZh-Fizika, No 12(I), Dec 70, Abstract No
12Zh631)

Translation: The properties of the Au-BaO system were studied by external photo-effect and thermoemission methods. The measurements were conducted in sealed devices in a high vacuum ($p < 5 \cdot 10^{-9}$ mmHg). It was shown that for surface concentrations $n_{\text{BaO}} > 1 \cdot 10^{15} \text{ cm}^{-2}$ the BaO film has photoelectric properties of thick oxide coatings and, in particular, sensitivity to ultraviolet radiation. The nature of the changes in emission properties of the Au-BaO system to $T = 1200^\circ\text{K}$ does not indicate chemical interaction of the BaO film with Au. Authors abstract.

"Cooling the Heated Region Formed in the Breakdown of Air Under Laser Radiation".

Moscow, Zhurnal Prikladnoy Mekhaniki i Tekhnicheskoy Fiziki, No 2, 1973, pp 54-63

Abstract: As a result of the high concentration of energy at the point of air breakdown under laser radiation, the air at that point may reach a temperature and pressure of the same order as those in the fireball of a nuclear explosion at the moment the heat wave forms the shock wave, according to the authors' calculations. In this paper, they describe a unidimensional method for computing the cooling of the breakdown point and, using numerical methods, solve the problem of whether a change in the optical thickness of the fireball leads to a sharp change in the optical phenomena and a change in the proportion of the radiated energy. At the same time, they determine the intensity and flux of the radiated energy from the fireball -- i.e., they determine the characteristics of the laser explosion as the source of optical and ultraviolet emission. For the sake of simplifying the problem,

"Tensor Nature of the Hall Effect in Metallic Ferromagnetics"

Leningrad, Fizika Tverdogo Tela, No 6, 1973, pp 1665-1667

Abstract: The experiments described in this paper were performed to help resolve the contradictions in the literature regarding the anisotropy of the ferromagnetic Hall coefficient. The experiments consisted in measuring the Hall emf in iron silicide single crystals with 3% Si and in 50/50 iron-nickel alloys -- FeNi -- of the hypernic type. The iron single crystal was in the form of a rectangular plate measuring 20X3.5X0.4 mm, and the hypernic single crystal took the form of a parallelepiped of 15X3X2 mm. The results of the experiments are given in the form of two curves, the first showing the magnetization and the Hall emf coefficient as functions of the magnetic field intensity for the iron silicide single crystal at 20° C, the second giving the magnetization and the coefficient E_x for the spontaneous Hall field as functions of the magnetic field intensity of the hypernic crystal at the same temperature. The factor E_x appears in the tensor for the anisotropy of odd galvanomagnetic effects and is given here in matrix form. The authors
